A company maintains Microsoft Power Platform development, staging, and production environments. Each environment has separate Microsoft Dataverse tables and an Azure AI Search index.

You are designing an application lifecycle management (ALM) process to deploy a Microsoft Copilot Studio agent between those environments.

The company has a Copilot Studio agent called Agent1 in development. Agent1 uses these grounding data sources:

- A Dataverse table named CustomerOrders
- An Azure AI Search index named customer-knowledge

You need to deploy Agent1 to production. The solution must ensure the agent uses the production grounding sources, minimize downtime, and handle credentials and endpoints securely.

What should be included in the deployment-package solution, and what should be reconfigured after deployment?

Home

Browse

Saved

Learn

Exam

Blitz

Survival

Select... → Agent1 and references to the data sources

Reconfigure after the deployment: Select... → The environment variables

⌕

Hide Answer

1

↑ 0 ↓

EXPLANATION

In Copilot Studio, agents are first-class Power Platform solution artifacts, and a solution should carry the agent plus references to its knowledge/grounding sources — not the underlying Dataverse rows or the Azure AI Search index themselves, which already exist independently in each environment. Environment variables are the ALM mechanism that makes a solution portable: they hold the environment-specific endpoints (for example the production Azure AI Search endpoint and index name) and can source values securely from Azure Key Vault, so you point the agent at the production grounding sources by setting the variable values after import rather than editing the published agent, which minimizes downtime. Shipping the data sources or live connections in the package would either overwrite production data or leak dev credentials, so those options are wrong. Connection references handle the credential binding during the import wizard, but the endpoint/source retargeting that the question stresses is done through environment variables.

Question 28 Plan AI-powered business solutions

A company operates multiple AI models that generate sales transactions.

Every model release must be reviewed by a security and compliance team before deployment to the production environment. To properly identify potential exposures introduced, the security and compliance team must be able to access earlier versions.

You need to recommend a solution for evaluating the impact of every production deployment. The solution must improve business continuity.

What should you recommend?

A Create a central model registry that uses version history.

B Establish a promotion process by using a quality gate.

C Implement version control for all the AI system components.

D Track model retirement schedules to prevent service disruptions.

Hide Answer

version control for all AI system components creates an audit trail of changes and enables rapid identification and rollback of problematic models, data pipelines, and system configurations. This supports security and compliance review of previous states and improves business continuity by allowing restoration of a known-good configuration.

Learn

Exam

Blitz

Survival

Design a governance solution that meets these requirements:

- Limit access to the grounding data to assigned roles.
- Limit model fine-tuning to only the AI engineering team.

What should the design include?

Select

Restricts access to the grounding data:

Select...

[→ Microsoft Purview access policies](#)

Restricts model fine-tuning:

Select...

[→ Role-based access control \(RBAC\) in Microsoft Foundry](#)

Hide Answer

EXPLANATION

Microsoft Purview access policies provide centralized, role-based governance of access to supported data assets, including governed data used for grounding. Azure AI Foundry uses Azure RBAC to control actions and permissions; assigning fine-tuning permissions only to the AI engineering team restricts who can fine-tune models.

Question 50

Design AI-powered business solutions

- Chief Technology Officer (CTO): Select one prebuilt AI agent for Dynamics 365 Finance, Dynamics 365 Supply Chain Management, or Dynamics 365 Commerce, and one custom Microsoft Copilot Studio AI agent, to prioritize and deploy during the initial adoption phase.
- Chief Information Officer (CIO): Ensure appropriate security labels are assigned to data used by the AI agents.
- Chief Financial Officer (CFO): Analyze the return on investment (ROI) for the AI agents being deployed.
- Chief Information Security Officer (CISO): Discover and inventory AI resources for auditing.
- Chief Executive Officer (CEO): Ensure all solutions follow industry-standard responsible AI practices.

Every AI initiative and agent will have a detailed business use case, a defined audience profile, and an estimated ROI that compares cost savings from the current process with estimated costs of the new AI solutions.

The research and development (R&D) department already has a custom Model Context Protocol (MCP) server containing comprehensive product specifications and compliance data.

The CTO has not yet chosen a prebuilt agent for Dynamics 365 Supply Chain Management and wants to view available agent templates to determine which agent provides the greatest business value. Depending on the high-priority AI agents identified, their capabilities must be previewed during a discovery meeting with the relevant business-operation stakeholders.
